Dental ceramics: a review of new materials and processing methods

Kerr Dental is proud to offer a full line of rotary diamond discs in a variety of sizes, types, and grits.

Digitization of simulated clinical dental impressions: Virtual three

One great advantage of restorations produced via CAD-CAM systems is the fact that the blocks used for production of the veneering layer are originated from optimized sintering procedures carried out by the manufacturer under ideal industrial conditions, which results in mechanically stronger blocks with less defects when compared to the veneering layers obtained by the previously described methodologies. Irrespective of the impression technique, all dental impression materials are introduced into the oral cavity right after having been mixed and come in direct contact with the oral tissues. Gypsum products- Type IV Dental Stone Type V Dental stone 2.

Tooth preparation techniques for porcelain laminate veneers

However, materials with a high crystalline content still require a veneering layer constructed with a compatible porcelain in order to achieve a more favorable aesthetic result. Therefore, monolithic Y-TZP restorations with good surface finishing are not likely to wear significantly the antagonist element.

Elastic and plastic properties of elastic dental impression materials

Examples include incomplete material setting, tray and wash material incompatibility, drags, and pulls. The radiopacity degree required for ideal clinical performance can vary within the same class of material 14.

Dental Materials

The IOS accuracy varies with the quality of the point cloud obtained depending on the hardware and software algorithms.
