**ABSTRACT:** The complexity of the police work environment has increased in recent years. Police officers are subjected to dynamic loadings in their work environment. These dynamic loadings are categorized into physical, psychological, and social loadings. This study aims to investigate the response of police staff to dynamic loadings. The study uses a questionnaire to collect data from police staff. The results show that police staff have a high level of response to dynamic loadings. The results also show that police staff have a high level of response to physical loadings, but a low level of response to psychological and social loadings. The results suggest that police staff should be trained to deal with dynamic loadings. The results also suggest that police staff should be provided with a supportive work environment. This is a preliminary study and needs to be further investigated.

### 1. INTRODUCTION

Police work is a highly complex and dynamic job. Police officers are subjected to a variety of stressors in their work environment. These stressors can be categorized into physical, psychological, and social stressors. Physical stressors include long hours of work, physical exertion, and exposure to dangerous situations. Psychological stressors include high levels of responsibility, pressure to perform, and exposure to traumatic events. Social stressors include interactions with the public, colleagues, and family. These stressors can lead to a variety of negative outcomes, including physical health problems, mental health problems, and substance abuse.

Police officers are also subjected to dynamic loadings in their work environment. Dynamic loadings are defined as the changes in the work environment that require police officers to adapt to new situations. These loadings can be categorized into physical, psychological, and social loadings. Physical loadings include changes in the physical environment, such as the location of the incident or the weather. Psychological loadings include changes in the psychological environment, such as the level of danger or the presence of weapons. Social loadings include changes in the social environment, such as the presence of bystanders or the media. These loadings can lead to a variety of negative outcomes, including physical health problems, mental health problems, and substance abuse.

Abstract: Based on the need for effective solutions of structures response to seismic loading, this thesis includes the theoretical background, and explanation of several methods. The analysis is first done assuming linear behavior of the soil and structure and then nonlinearities and permanent deformations are included.
