Handbook on the Neuropsychology of Epilepsy

Occasionally, a seizure disorder will disappear as a child matures, but in a majority of cases, epilepsy persists into adulthood, and in 80% of adults with epilepsy, this condition developed when they were children.

Neuropsychological Tests

Video and EEG recordings of seizure activity are acquired continuously 24 hours a day, with EEG technicians available around the clock to assist in monitoring. At least two unprovoked seizures are generally required for an epilepsy diagnosis.
