### Ecology

Patches are either occupied or they are not. Metapopulation models examine patch dynamics over time to answer questions about spatial and demographic ecology.

### Population ecology

Bucks might be targeted to increase buck competition, or does might be targeted to reduce reproduction and thus overall population size. Focus on vocabulary and methods of studying ecology. A final important feature is the pattern of dispersion.

### Population ecology

The first variable is  $r$  the intrinsic rate of natural increase in population size, density independent and the second variable is  $K$  the carrying capacity of a population, density dependent. In metapopulation terminology there are emigrants individuals that leave a patch and immigrants individuals that move into a patch.

### Population ecology

Subpopulation An arbitrary spatially delimited subset of individuals from within a population as defined above. Check out the following article to learn more! Managers injected female horses with a vaccine that caused immune cells to attack sperm cells. A Stage I population model describes the rate of growth as defined by the difference between the birth rate and the death rate.

### Population Growth

In contrast, a  $K$ -selected species such as humans has low rates of fecundity, high levels of parental investment in the young, and low rates of mortality as individuals mature.

### Ecology

There are three basic models.

### **Population Growth**

The probability of surviving any particular year of age<sup>2</sup>. Princeton, NJ: Princeton University Press.

### **Population Growth**

. L; Kleisner, Kristin; Pakhomov, Evgeny; Pauly, Daniel 2012. Local population A group of individuals within an investigator-delimited area smaller than the geographic range of the species and often within a population as defined above.
