## Human Population Biology

The difference between biological potential and realized fertility is determined by several intervening factors, including the following: 1 most women do not begin reproducing immediately upon the onset of puberty, which itself does not occur at a fixed age; 2 some women with the potential to reproduce never do so; 3 some women become widowed and do not remarry; 4 various elements of social behaviour restrain fertility; and 5 many human couples choose consciously to restrict their fertility by means of, contraception, abortion, or sterilization. The current theory and applied aspects of the subject matter are evaluated on the basis of current books and review articles.

## Population and environment: a global challenge

However, there are debates about incentive programs such as paying women in India to undergo sterilisation. We propose a series of questions reflecting development, systems biology, diseases, clinical approaches and tools, and population health, and a call for scientific action.

## Chapter 52

This relates not only to individuals but also governments. Furthermore, the role of human activity in causing climate change has become a hotly debated socio-political issue in some developed countries, including the United States.

## 19.3 The Human Population

Modernization and Adiposity: Causes and Consequences, S. Unlike previous geological epochs, where various geological and climate processes defined the time periods, the proposed Anthropocene period is named for the dominant influence humans and their activities are having on the environment.
