Foundry Technologies

Air Hardening Full hardening of a metal or alloy during cooling in air or other gaseous medium from a temperature above its transformation range.

KUKA foundry robotics

Furnace design is a complex process, and the design can be optimized based on multiple factors. Abrasive materials come in all shapes and forms, powders, bonded to wheels, boards, papers; they can be sand, files, emery, and so on.

KUKA foundry robotics

Alloy A substance having metallic properties and composed of two or more chemical elements of which at least one is metal. Additives Any material added to molding sand for reasons other than bonding or improvement of bond is considered an additive. With Foundry, leading organizations are accelerating their end-to-end data transformation — and redefining their industries.

CF Foundry Web Application Development

The process includes melting the charge, refining the melt, adjusting the melt chemistry and tapping into a transport vessel. Acceptable Quality Level AQL A quality level established on a prearranged system of inspection using samples selected at random.

About us

This process is most frequently applied to aluminum. Many castings are machined in centers.

CF Foundry Web Application Development

Special covers ensure necessary protection in harsh industrial environments. The robust KUKA washing robot is resistant to alkalis, acids, heat and corrosion Payload from 240 to 600 kg.

About us

Air Setting The property of some materials to take a permanent set at normal air temperature. Electricity, propane, or natural gas are usually used to achieve these temperatures.
