Many of the reports written during World War II have been released in open file or in mimeographed form for limited distribution; others contain confidential information, hence have not been made available to the public. The minor occurrences of cassiterite show that tin mineralization is present in the part of Alaska extending westward from the vicinity of the international boundary near the Yukon River, to Cape Prince of Wales at the extremity of the Seward Peninsula, and southwestward from somewhat north of Fairbanks nearly to Bristol Bay. The deposits at Kennecott, which have been worked out, were largely replacement bodies along fracture planes in limestone.
