This unique resource also includes statistics on the frequency of specific arterial variations and explanations of their embryologic origins.

Popliteal artery: Anatomical study and review of the literature

The diameter of the femoral artery at the level of inguinal ligament correlated with the diameter of the DFA and distance to where the DFA arises from femoral artery. In type II, the MFCA is absent and the LFCA origin normally from the DFA 18. The normal path of the VA in the cervical transforaminal column is immediately anterior to the CTESI target zone.
