Schematic of the eggs loading. In high frequency electromagnetic applications soil water content is quantitatively derived from the propagation behavior of electromagnetic waves along waveguides embedded in soil formations.

As is described by Bitz and Battisti 1999 , daily 500-mbar height anomalies at each grid point were band-pass filtered to isolate variability with timescales of between 2 and 8 days; the monthly root mean squares of these high-frequency fluctuations were then used to map changes in monthly mean storminess. Pain as a presenting symptom in children and young adults with newly diagnosed malignancy.
