Double Rainbows Twin rainbows are similar to multiple rainbows with one big difference: Multiple rainbows run parallel to each other but they are in fact separate.

**Awesome almanac. Wisconsin (Book, 1993) [tech.radiozamanah.com]**

Monochrome Rainbows These rainbows are always a single color rather than the full spectrum—almost always red. This phenomenon is exceedingly rare because it takes a special set of circumstances.

## 7 Types of Rainbows That Remind You Nature is Awesome

Series Title: Responsibility: created by Jean F. This is the reason why fogbows are most commonly spotted in the mornings and evenings, or from high vantages that place the viewer above the fog, like on a mountainside, seaside cliff, or even from an airplane. Now if we could only find those pots of gold reputed to be at the end of each one! With a uniquely interactive format, this book has smart readers engaged and eager at every step with essential facts on food, history, science, pop culture, and more.

## 7 Types of Rainbows That Remind You Nature is Awesome

It is this bending of light that causes it to split into its individual color wavelengths of red, orange, yellow, green, blue, indigo, and violet.

## 7 Types of Rainbows That Remind You Nature is Awesome

Circular Rainbows Did you know that all rainbows are technically circular in shape? This type of rainbow only happens at sunrise or sunset, when rays of light from the sun have to travel the furthest distance through the atmosphere. All the other wavelengths of light are shorter, so they scatter, which leaves only red behind.
