Warming seas and melting ice sheets

Observational data were validated and calibrated by R.

NOAA / NESDIS / STAR

Changes in RSL, either a rise or fall, have been computed at 142 long-term water level stations using a minimum span of 30 years of observations at each location.

Reassessment of the potential sea

Deeper in the water column, the Upper Circumpolar Deep Water layer region C in Fig. Watch this video to learn about sea level rise! Horizontal station spacing was nominally 55 km, often less over rapidly changing bathymetry.

Climate Change Indicators: Sea Surface Temperature

The westerlies, the winds that spin the ocean waters around Antarctica, have intensified during the last decade, pushing the cold, top layer away from the land. It's also one of the biggest problems that global warming is causing.

Sea Level Trends

Then, the volume-weighted means for the variance and DOF below 4000 m are found using the σ at each depth for a weight in the vertical integration.
