When more power is needed, such as when rapid acceleration is needed or for heavy-load electric power generation, preferably the air bypass valve ABV 4 is closed and the shutter valve 3 is opened.

Alternatively, all of the air charge can be directed through the intercoolers 10, 11 and 12 or through bypass conduits 121 and 122, to the manifolds 13 and 14.

The exhaust valves remain open after bottom dead center for further scavenging of the cylinder 7. Shutter valve 3 and air bypass valve 4 could direct all of the charge from compressor 1 passed intercoolers 11 and 12 with the heat-of-compression retained, into manifolds 13 and 14 and to the cylinder for the less dense, more fuel efficient operation mode. Among its other components, this embodiment is seen as having two compressors, three intercoolers, four control valves, dual air paths for both the primary and the ancillary compressors, dual manifolds and showing a means of controlling charge-air pressures, density and temperatures. For medium-load operation the shutter valve 5 of compressor 2 is closed and the air bypass valve 6 would be opened to pass the air-charge uncooled and without compression to the intake of compressor 1 where closed shutter valve 3 and closed air bypass valve 4 directs the air charge now compressed by compressor 1 past the intercoolers to manifolds 13 and 14 with the air compressed and heated by compressor 1, for medium-load operation.
