Mediterranean Seafloor Features: Overview and Assessment

All these observations suggest that the Ketama-Tanger Basin developed and probably enlarged to the NE. We compare our tectonic-responsive results with models that incorporate active surface processes to constrain the conditions under which surface processes modulate magmatic injection.

Mediterranean Seafloor Features: Overview and Assessment

Only volcanic bodies provide a local discontinuity of the MSC on the Sardinian slope. Less frequently they cause intense deformation in the UPQ units and breach through the sea bottom, , and.

Influence of differential compaction above basement steps on salt tectonics in the Ligurian

We compare two crustal end-members model series, one with a stiff crust, and the second with a weak crust.

Mud Redepositional Processes as a Major Influence on Mediterranean Margin

In summary, the development of a foredeep in front of the western Tell and Rif depends on the tectonic underplating, which led to the formation of the EMM and external tectonic windows, combined with a thin effective elastic thickness of the lithosphere.
