Aquatic bacterial diversity: Magnitude, dynamics, and controlling factors

Power generation and the environment. Extending this target to 2030 will increase coherence with other targets and encourage continued action.

Bending the Curve of Global Freshwater Biodiversity Loss: An Emergency Recovery Plan

Many models also predict an increase in the frequency and severity of floods and droughts.

Conservation Status of the World's Fish Fauna: An Overview

Priority action 5: Control invasive species CBD target 11: Protected areas Amend and new: Define a distinct subtarget for proportion of inland waters under protection by 2030. Scientific restoration and rehabilitation of running waters and wetlands is less well developed.

Aquatic bacterial diversity: Magnitude, dynamics, and controlling factors

Priority actions include accelerating implementation of environmental flows; improving water quality; protecting and restoring critical habitats; managing the exploitation of freshwater ecosystem resources, especially species and riverine aggregates; preventing and controlling nonnative species invasions; and safeguarding and restoring river connectivity. UNESCO United Nations Educational, Scientific and Cultural Organization. From this starting from conceptualization and literature reviews or reports of environmental impacts, assessments are made on the environmental impacts most relevant.

IMPACTOS SOCIOAMBIENTAIS DE HIDRELÉTRICAS E RESERVATÓRIOS NAS BACIAS HIDROGRÁFICAS BRASILEIRAS

We briefly discuss 4 important challenges for freshwater conservation.

[PDF] Freshwater biodiversity conservation: recent progress and future challenges

This study compiled and analyzed resilience traits of European lampreys and fish species to derive a novel sensitivity classification of species to mortality.

Imperiled waters, impoverished future: the decline of freshwater ecosystems

Systematic freshwater conservation planning tools, which combine stakeholder engagement with algorithm-based spatial assessment taking specific account of hydrological factors, can aid prioritization of freshwater habitats for efficient conservation and restoration investments Reis et al. Here, we briefly describe areas of recent progress in freshwater biodiversity conservation.
