Continuous Wear Revisited: Whatâ€™s the Case for It?

A large post-marketing study showed that MK rates were similar to low-Dk extended wear, and a meta-analysis of studies indicated silicone hydrogels had twofold increase in corneal inflammatory events. Jalbert and Stapleton 12 concluded that extended wear of hydrogel lenses reduces stromal keratocyte density. In congenital amaurosis, both rod and cone responses are extinguished.

The limbal vascular response to extended contact lens wear was examined in a group comparative study initially intended to last eighteen months. The presence of an ectopic bright spot places the child at higher risk for neuroendocrine dysfunction. However, the objective findings of significant vascular changes, micro-epithelial cysts and cases of acute red eye response cast considerable doubt on the recommendation of extended wear contact lenses for purely cosmetic applications.
