Famous mineral localities: The Chester emery mine

Other rare and beautiful arsenate species from Ojuela include brilliant green Austinite crystals, blue Kottigite sprays, and blue-gray Symplesite blades.

Famous mineral localities

Sadly, all good things must come to an end, and in the case of Mont Saint Hilaire it had less to do with geology and mineralogy and more with the whims of quarry management and demand for aggregate rock. Many other substances are extracted including titanium, asbestos, silver, magnesium, nickel and many other metals and industrial minerals. Willemite even occurs rarely as flawless, gemmy prisms in attractive shades of green and yellow to blue to 4 or 5 cm.

Zircon: The mineral zircon information and pictures

The presence of cavities lined with crystals was reported as early as 1863 by Sir William Logan in his Geology of Canada. To this day, compensation, benefits and especially job security have typically been at the heart of labour disputes, as the industry has decreased its reliance on labour through increased mechanization. Wulfenite from Ojuela is somewhat unusual in its variety of crystal forms: almost equant, pseudo-cubic crystals are not uncommon, as are elongated, dipyrasidal crystals.

Sabinaite: Mineral information, data and localities.

These sites are special for a number of reasons. During this period, many fine examples of galena and sphalerite were also found, with galena crystals from the Hill-Ledford mine sometimes reaching 15 cm on edge. Canada's third diamond mine, and first, was the Jericho mine, established 400 km northeast of by the Tahera Diamond Corporation.
