Global Greenhouse Gas Emissions Data

We will need a menu of solutions: changes to diets; food waste reduction; improvements in agricultural efficiency; and technologies that make low-carbon food alternatives scalable and affordable. As the global population and water supplies are unevenly distributed, however, some regions are more water scarce than others.

The World in 50 Years

That will probably require most people to accept radical dietary changes, however, which are unlikely to be popular.

Emissions by sector

Coal became dominant in the late 19th century before being overtaken by petroleum products in the middle of the last century, a time when natural gas usage also rose quickly. One of the commonly accepted 'right steps' many governments are taking today is in fact one such misstep: the provision of further energy subsidies.

Energy sources have changed throughout the history of the United States

But in many countries — particularly richer countries trying to improve energy efficiency — energy consumption is actually falling.

World Resources Institute

In areas such as the and Europe, changes in land use associated with human activities have the net effect of absorbing CO₂, partially offsetting the emissions from deforestation in other regions.

Emissions by sector

You can explore emissions by sector from the World Resources Institute. In Ethiopia the figure is 2ha, falling to just half a hectare for Burundi, the country that consumes least resources. Evidently, the lack of economic alternatives unfortunately leaves cheap fuels such as coal still contributing to

a significant part of the energy mix.

Global Greenhouse Gas Emissions Data

East Africa, the Caribbean and South and West Asia experience the highest prevalence of undernourishment. Since the mid 20th century, use of coal has again increased mainly as a primary energy source for electric power generation , and a new form of energy—nuclear electric power—emerged. Per capita: where do people consume the most electricity? Experts, however, say it is difficult to ascertain how many species have vanished for ever because a species has to disappear for 50 years before it can be declared extinct.
