Based on our results, we conclude that the investigated areas were probably shelter zones for wild grapevine preservation during the unfavorable glaciation era.

**The 1991**

Intense line-source runoff of water and suspended sediments form a geostrophic alongshore current of turbid and freshened water, which induces intense transport of suspended and dissolved constituents discharged with river waters in a north-western direction. Agricultural reclamation significantly improved SOC contents of 0-20 cm depth from 0. In addition, vertical-axis rotations between CRBG sites in the Portland area and sampling localities within the same flow units on the relatively stable Columbia Plateau were calculated.

These events are favoured by intense air-sea interactions and it is reasonable to hypothesize that the Adriatic sea surface temperature SST can affect the amount and location of precipitation. In this way, we analyze human factors that have been able to influence the variability of floods along last 6 centuries demography, hydraulic infrastructures, urban development.

### **Formats and Editions of Palau coastal resources survey : phase I, Babelthaup [sic] and Koror, selected sites [tech.radiozamaneh.com]**

Izmir Bay, Canakkale Strait entrance, Saros and Candarli Bay were defined low pollution extent according to Principal Component Analysis taking into metal accumulation. Furthermore, among the tested species, extracts of U.

#### **The 1991**

Additionally, X-ray fluorescence analysis provided information about the content of major elements in samples and indicated the significant amount of Ti 7. Most likely origin of these event deposits is great tsunami, because the coring site is a deep and low energy bay floor isolated from major river mouth. Besides similar quality of life markers, these populations also had similar biological markers.
