[PDF] An overview of skin penetration enhancers: penetration enhancing activity, skin irritation potential and mechanism of action

In comparison with the comprehensive databases providing the content in the diet of the established micro- and macro-nutrients, data for the contents of PPT are much more limited. B Ka and P eff came from *in situ* single-pass intestinal perfusion experiment. Mainly mammalian conjugates of microbial metabolites 400 - 570 20 - 285 Plasma Pseudo-Pharmacokinetics Since for the majority of dietary PPT, neither the conjugates consumed, nor their free aglycones, are detectable in plasma, it is rarely possible to perform true pharmacokinetic analyses.

Preparation of single-pass intestinal perfusion model *in situ* Single-pass intestinal perfusion methods *in situ* were performed according to the previous report.

## **Skin Delivery of EGCG and Silibinin: Potential of Peptide Dendrimers for Enhanced Skin Permeation and Deposition**

Black tea and coffee, the major sources of PPT, are poor sources of ascorbate.

## Mechanism of Mucosal Permeability Enhancement of CriticalSorb® (Solutol® HS15) Investigated In Vitro in Cell Cultures

Devarakonda B, Hill RA, Liebenberg W, Brits M, de Villiers MM. All three neuroleptics significantly displaced methadone from AAG.
