Pathogenesis of Human Poliovirus Infection in Mice

A very recent study identified a role for two-pore channels TPCs in EBOV infection. Protocols for the production, propagation, quantification, and purification of PV are presented. In 1946 she discovered that the virus is present in human blood during the incubation period of the infection but disappears later, when the neurologic symptoms begin.

Poliovirus: generation, quantification, propagation, purification, and storage

Enterovirus — Infects intestinal tract 2. When the virus within the blood fails to gain access to the central nervous organs, and to set up paralysis, it is destroyed by the body, in course of which destruction it undergoes, as a result of the action of the spleen and, perhaps, other organs, diminution of virulence. The virus injected into the blood is deposited promptly in the spleen and bone marrow, but not in the kidneys, spinal cord, or brain.

Molecular mechanisms of Ebola virus pathogenesis: focus on cell death

Estimates of the ratio of asymptomatic to paralytic illness vary from 50:1 to 1,000:1 usually 200:1.

Pathogenesis of Human Poliovirus Infection in Mice

Day 13 and a higher incidence of paralysis 97% vs.

Poliovirus: Characteristics, Epidemiology, Serotypes, Mode of transmission, Pathogenesis, Clinical manifestation, laboratory diagnosis, Prevention and control

Horstmann's early research focused on the pathogenesis of the poliomyelitis virus.

Horstmann, Dorothy M. (Dorothy Millicent), 1911

From 1955 to 1961, the Yale Poliomyelitis Unit evaluated immunization against poliomyelitis with live, attenuated vaccine, the Sabin vaccine.

Pathogenesis of Human Poliovirus Infection in Mice

The VP35 has been shown to suppress IFN- β production through multiple inhibitory effects that include the disruption of RIG-1 pathway by preventing IRF-3 phosphorylation, the inactivation of IRF-7, and the inhibition of activation of IFN-inducible dsRNA and Dicer-dependent protein kinase R. Poliomyelitis has afflicted humankind since antiquity, and for nearly a century now, we have known the causative agent, poliovirus.
