Vaccine Side Effects and Adverse Events

In the past, vaccines have taken many years to develop. The number of serious problems in test participants was very low, and there was little difference between those who received the actual vaccine and those who received a placebo.

Evidence grows stronger for Covid vaccine link to heart issue, CDC says

Pregnant women may also be advised to wait for the vaccination. The next morning, on Christmas Day, the man was seen standing still with his eyes half open and his mouth foamed. The FDA and other reviewers closely consider diverse populations included in the trials for safety purposes.

Pfizer, a vaccine with endless problems and controversy

However, these vaccines may not be right for everyone. Data on local reactions were not solicited from persons aged 16-17 years. Hopefully if they have more understanding into the EUA process, and perhaps speak with their doctors, they can be persuaded to be vaccinated.

Past vaccine disasters show why rushing a Covid

Therefore, it may be difficult to control and evaluate the data. Fever was more common after the second dose and in the younger group 15.

Vaccine Side Effects and Adverse Events

Fever was more common after the second dose than after the first dose.

Feature Article: Long

But I do know that undermining their concerns won't help if there is any hope of them getting vaccinated. Vaccines, though they are designed to protect from disease, can cause side effects, just as any medication can.

COVID

In 1999, while working at the Walter Reed Army Institute of Research, he dubbed complement activation-related pseudoallergy CARPA , a nonspecific immune response to nanoparticle-based medicines, often PEGylated, that are mistakenly recognized by the immune system as viruses. For both age groups, fatigue, headache and new or worsened muscle pain were most common. The average onset of symptoms occurred within seven weeks of vaccination.

COVID

The majority of systemic events were mild or moderate in severity, after both doses.
