## Explore the Seasons

Risk Management Unintended consequences of cloud seeding, such as changes in precipitation or other environmental impacts downwind of a target area have not been clearly demonstrated, but neither can they be ruled out. This backup capability is important to the overall capacity of the system to provide hydrologic and meteorological coverage to all areas with minimal interruptions, even in the event that an entire field office becomes inoperable.

These tests have increased confidence in the backup scenario. If the seasons are very similar in your area, distinguish the seasons by discussing holidays and celebrations in each season. Some locations are especially vulnerable, as they will be flooded by sea level rise or put at substantially greater risk of stronger hurricanes and storm surges or many water-stressed regions are likely to receive even less precipitation in the future despite populations that continue to grow.

## Planned Weather Modification through Cloud Seeding

In its most common form, specially formulated aerosols or very cold materials are dispersed in targeted locations within clouds to achieve precipitation enhancement, hail damage mitigation, fog clearing, and other intentional effects. The site backup and recovery testing planned in the Build 4 time frame should include a thorough evaluation of the potential for cascading failure of nodes.

## MODIFYING THE WEATHER: A SOCIAL ASSESSMENT. By W. R. D. Sewell, New Zealand Geographer

The collection is freely available and ready to be adapted by undergraduate educators across a range of courses including: general education or majors courses in Earth-focused disciplines such as geoscience or environmental science, social science, engineering, and other sciences, as well as courses for interdisciplinary programs.

## **Planned Weather Modification through Cloud Seeding**

At times unintended effects may cross political boundaries. A program of precipitation augmentation is more effective in cushioning the impact of drought if it is used as part of a water management strategy on a long-term basis, with continuity from year to year, whenever opportunities exist to build soil moisture, to improve cropland, and to increase water in storage. ### **Explore the Seasons**

NCF distributed and installed software with fixes for identified bugs with minimal involvement of field office staff. One tool available for mitigating some of these weather impacts is planned weather modification through cloud seeding.

### **Summative Assessment: Local impacts of climate change**

If these attitudes and practices become widespread, the NCF design concept will be vitiated in operation. . Based on feedback from you, our users, we've made some improvements that make it easier than ever to read thousands of publications on our website.
