Tool Calibration and Control System

The Tool Calibration and Control System is an overarching system within your Quality Assurance Management Systems.

5 Steps to Setting up a Flawless Quality Control Program

Lets say the oven needs to be set at 125 C.

Standards & Measurements

Description: 1 volume Series Title: , 87-3596. The true value of the standard is obtained from its calibration.

5 Steps to Setting up a Flawless Quality Control Program

Remember, in-house quality control is a process. Instituting an in-house quality control program begins by creating a Master Set of new Inspection or Calibration sieves as a benchmark. Primary standards are usually kept at NIST or calibration labs and maintain NIST certification. NIST operates several stratum-1 network time servers, which means their time is directly linked to UTC NIST, the official NIST time.

Conducting Calibration Studies

Calibration Standards There are 3 types of standards in your tool calibration and control system: Primary Standards: Those units or instruments of highest quality and stability which are periodically calibrated by the National Institute of Standards and Technology NIST or by other contract calibration services which have direct traceability to NIST. The best way to do this is to record the serial number of each sieve in the stack and double-check these records before any comparison is done. There are many updated GMPs, GLPs, and SOPs in the following publications that

were originally published in HB 145; only updated versions are provided here when available.

Conducting Calibration Studies

Here, the equipment variation does not only include that due to the gage itself, but also to other equipment included in the measurement system such as fixturing. Check out our latest projects: Quality Steering Committee The AIAG Quality initiatives are guided by the Quality Steering Committee. Used for analog and digital readouts that are monitored with other calibrated equipment.
