**Oliver M.B. Bulman (1902)**

Für den Ursprung und die frühe Diversifizierung der Dendroidea, der wichtigsten benthischen Ordnung der Klasse Graptolithina, lässt sich für den Zeitraum Mittel- und Oberkambrium eine morphologische, stratigraphische und evolutive Entwicklungsreihe aufstellen. Stratigraphic framework and time slices.

**A Monograph of British Graptolites, Volume 1: Text**

The first three zones are discussed with their definitions and durations clarified, whereas the last zone is introduced for the first time as a replacement of the former Adelograptus-Clonograptus Zone. Of late years an opinion is gaining ground that they may be regarded as constituting collectively an independent phylum of their own Graptolithina. Graptolites from early Ordovician Maoping Formation of Chongyi, Jiangxi.

**Chapter 10 Patterns of Evolution in the Graptolites**

Linnaeus, *Systema naturae* 12th ed.

**general morphology and classification of graptolites**

A bud is given off from the sicula at a variable distance along its length. To avoid self-fertilisation, or inbreeding, zooids could have had the potential to be temporarily male, female or neuter. Based on a systematic study of Tremadocian graptolites from the Early Ordovician Yehli Formation at Dayangcha, Baishan of Jilin, NE China, a revised graptolite zonation is proposed for the Tremadocian rocks in the area.

**Dendroid graptolites from the Lower Ordovician (Tremadocian) of the Yichang area, Hubei, China**

Secondary endpoints were incidence of postoperative complications. Rhabdopleuran hemichordates: new fossil forms and review.

**Dendroid graptolites from the Lower Ordovician (Tremadocian) of the Yichang area, Hubei, China**

Die Form der Rhabdosome kann für die Klassifizierung bis hinunter zum Gattungsniveau verwendet werden.
