## A Brief History of Photography

The photograph contrasts the modern city with a Gothic cathedral: one sharp and clear, the other hazy and mysterious. In photography, the dye colors are normally cyan, a greenish-blue which absorbs red; magenta, a purplish-pink which absorbs green; and yellow, which absorbs blue.

Transparencies are also capable of a wider dynamic range and, therefore, of a greater degree of realism than the more convenient medium of prints on paper. The Cadett Lightning Spectrum plate, with an improved spectral response curve and greatly increased overall speed, was available by mid-1900.

In commercial practice, however, the use of bipacks was almost entirely confined to two-color motion picture systems.

Later, to make the image appear, the plate was then exposed to mercury vapor, and made permanent with a salt solution. In the mid-20th century, developments made it possible for amateurs to take pictures in as well as in. British forces, interested only in what they perceived as pure ancient Egyptian history, evicted the actual Egyptians who lived in the Medinet Habu complex and destroyed whatever they had built there.

The two layers behind it, one sensitized to red but not green and the other to green but not red, would suffer from scattering of the light as it passed through the topmost emulsion, and one or both would further suffer by being spaced away from it. In a few processes, the three images were created one on top of another by repeated coating or re-sensitizing, negative registration, exposure and development operations.

Subsequent innovations made photography easier and more versatile. Keen to define an Italian national identity, the king commissioned photographers, including the Alinari brothers of Florence, to travel the peninsula documenting the art and architecture of the nation.
