diagnostic, and therapeutic dimensions and research p. This view was furthered by Rew and Barrow , in their reviews of the literature, where they found that intuition was imperative to complex decisionmaking, difficult to measure and assess in a quantitative manner, and was not linked to physiologic measures. The following sections will summarize the contributions of narrative medicine to each of these 4 situations.

Clinical Reasoning, Decisionmaking, and Action: Thinking Critically and Clinically

As medical and health care literature is growing exponentially, all health care professionals, including nurses, need to possess good searching skills to quickly retrieve current, relevant, and accurate information. Conclusion The description of Ms Lambert at the beginning of this article was written by her physician the author after a recent office visit and shown to her on the subsequent visit. The heterogeneity of studies was expected as the professional boundaries of nurses differ across countries.

Narrative Medicine: A Model for Empathy, Reflection, Profession, and Trust

However, they have three shortcomings, the first of which concerns their generalizability. This means that those nurses who had previously attended EBP training considered it useful. As evidence evolves and expands, so too must clinical thought.

In addition, the relationship between the overall self-efficacy of nurses and their highest professional qualifications was found to be highly significant at the 0.

Adopting evidence

The changing relevance entailed in a patient transitioning from primarily curative care to primarily palliative care is a dramatic example, where symptoms literally take on new meanings and require new treatments.

Physician and Nurse Relationships

Examples of preparing for specific patient populations are pervasive, such as anticipating the need for a pacemaker during surgery and having the equipment assembled ready for use to save essential time. Relevant patient populations may be excluded, such as women, children, minorities, the elderly, and patients with multiple chronic illnesses.
