Medical Device Recalls

It is characterized by loss of memory and intellectual function and by changes in mood. CIDP is closely related to Guillain-Barre syndrome and it is considered the chronic counterpart of that acute disease. Common symptoms of Cushing's syndrome include upper body obesity, severe fatigue and muscle weakness, high blood pressure, backache, elevated blood sugar, easy bruising, and bluish-red stretch marks on the skin.

BMC Neurology

People with the disorder frequently report that it appears or worsens after walking or standing. Menkes Disease Caused by a defective gene that regulates the metabolism of copper in the body. This sudden loss of muscle tone while a person is awake leads to weakness and a loss of voluntary muscle control.

Victims of neurology recall scandal facing new delay to findings

Symptoms of more serious headaches, including migraines, may be vomiting, a headache that becomes more severe or is continuous, a headache that comes on suddenly or pain that is worsened by strain, a headache that starts early in the morning, changes in vision, or even seizures. If the difficulty is sudden and happens in both eyes, you may want to have your vision evaluated.

What are the neurological complications of COVID

Intracranial Hypertension Idiopathic intracranial hypertension IIH , sometimes called benign intracranial hypertension BIH or pseudotumor cerebri PTC is a neurological disorder that is characterized by increased intracranial pressure ICP , in the absence of a tumor or other diseases affecting the brain or its lining.

If You Are Experiencing Dizziness

The abnormally shaped skull that results is due to the brain not being able to grow in its natural shape because of the closure. There is no bony covering over the back of the head and there may also be missing bones around the front and sides of the head. Hypersomnia Characterized by recurrent episodes of excessive daytime sleepiness or prolonged nighttime sleep.

Memory Disorders

Finally, interested patients can participate in the latest of new therapies. While some forms of meningitis are mild and resolve on their own, meningitis is a potentially serious condition owing to the proximity of the inflammation to the brain and spinal cord. Other symptoms may include sudden muscle weakness while awake that makes a person go limp or unable to move cataplexy , vivid dream-like images or hallucinations, and total paralysis just before falling asleep or just after waking up sleep paralysis.

Narcolepsy Fact Sheet

Melkersson-Rosenthal Syndrome A rare neurological disorder characterized by recurring facial paralysis, swelling of the face and lips usually the upper lip , and the development of folds and furrows in the tongue. Other symptoms may include visual agnosia inability to visually recognize objects , loss of normal fear and anger responses, memory loss, distractibility, seizures, and dementia.

Office of Neuroscience

Erb-Duchenne Erb's palsy refers to paralysis of the upper brachial plexus.
